

## ABSTRACT

A semiconductor chip comprises a semiconductor substrate having integrated circuits  
5 formed on a cell region and a peripheral circuit region adjacent to each other. A bond pad-  
wiring pattern is formed on the semiconductor substrate. A pad-rearrangement pattern is  
electrically connected to the bond pad-wiring pattern. The pad-rearrangement pattern  
includes a bond pad disposed over at least a part of the cell region. The bond pad-wiring  
pattern is formed substantially in a center region of the semiconductor substrate. Thus, with  
10 the embodiments of the present invention, the overall chip size can thereby be substantially  
reduced and an MCP can be fabricated without the problems mentioned above.
